

Visualizers and Whiteboards: The Perfect Combination

The Visualizer allows the presenter to display documents and 3-dimensional objects on the interactive whiteboard.

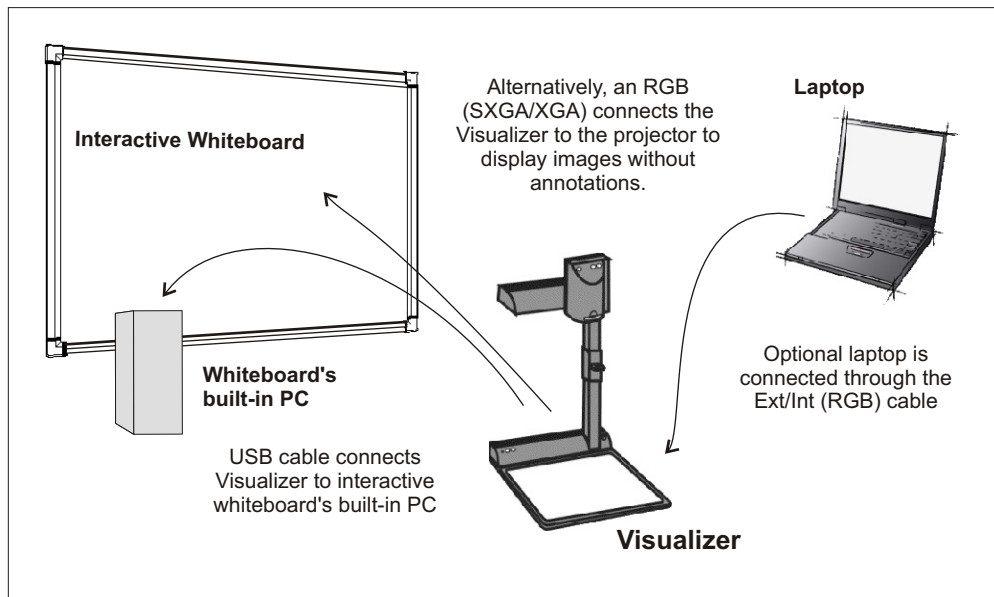

The interactive whiteboard turns your Visualizer and laptop into powerful tools for presentations and conferencing.

Any Visualizer image displayed on the whiteboard can be manipulated by drawing on its large, touch sensitive surface. Using a special pen, you can work with ease at the whiteboard to write explanatory notes in digital ink and highlight important information.

However, with the addition of a Visualizer you can turn the interactive whiteboard into the ideal presentation tool by being able to display images of 3-dimensional objects, books, slides, or X-rays on the board, draw on them and then save them for later use by means of your connected laptop or PC.

When scanning documents on a regular scanner, close ups of details are difficult. However the zoom function of the Visualizer allows you to zoom in on the tiniest details from objects or documents. In the same way, large objects or documents can be presented in a smaller format. Even live demonstrations are possible and displayed in real time.

Quick set up and easy use are great advantages of the Visualizer. The numerous uses of the Visualizer as a long distance, live presentation tool, the ability to save the work of those images onto a computer and to supplement PowerPoint presentations with live motion or 3D images all make the Visualizer indispensable.

The above diagram shows how the Visualizer can be connected to a whiteboard as well as a laptop to allow a truly interactive presentation. With the above assembly of devices, a presenter can motivate and involve his audience by writing or drawing directly on the displayed images of the whiteboard. By rotating the Visualizer camera head, the presenter can pick up live presentations from in front of or behind the device. These live presentations can also be displayed over a long distance and simultaneously in other rooms or buildings.

With a connected laptop, a presenter's favorite documents can be displayed, discussed and worked on. By pressing the Ext/Int button, PowerPoint presentations can come alive by switching from the PowerPoint templates to relevant 3 dimensional objects or a live demonstration to emphasize a point. These images can also be drawn on and saved for later referencing or to send along as an e-mail attachment to other participants.

With the Visualizer's new USB software, which can be downloaded from WolfVision's website, movie presentations can also be recorded, saved and sent along to any missing participants or even linked to a website for easy viewing.
