## WolfVision introduces vSolution MATRIX Feature Pack: AV over IP collaboration using Cynap systems

KLAUS, AUSTRIA – January 23, 2018. WolfVision, the manufacturer of presentation and collaboration technology solutions launches the vSolution MATRIX Feature Pack for its Cynap collaboration system at ISE 2018. When activated this AV over IP feature pack enables configuration, control, distribution, and sharing of video and audio between multiple workstation monitors using multiple Cynap, and Cynap Core units connected using network infrastructure.

This flexible collaboration solution is suitable for active learning classrooms, meeting and training rooms of all sizes, where the requirement is for multiple workstations to be deployed to leverage collaborative learning and working.

A single Cynap unit, designated as the 'main' system in the room, is connected to multiple workstations with either a Cynap or a Cynap Core system installed. Audio and video content is shared between connected monitors and the main screen in the room over the network, using a simple drag and drop interface, with all processing performed by the installed Cynap systems themselves. This eliminates the need for additional encoding/decoding hardware.

Wireless BYOD screen sharing for all smartphones, tablets, and laptops, is available at every workstation, with no need for apps, dongles or additional software. Annotation and whiteboard functionality is provided and the Cynap built-in media player handles playback of any content accessed from cloud, network or other connected sources.

Enterprise level encryption ensures secure delivery of content materials between workstations, and this scalable, cost effective, presentation and collaboration solution gives all the performance, and reliability associated with traditional AV distribution methods.
